

## RedTitan LMS Converter

### View, Transform and Store your Xerox DJDE Documents

The RedTitan LMS converter is a true DJDE emulator running on a windows PC, any windows user can view a Xerox DJDE or Metacode print job as it would have printed to a Xerox © DJDE printer, then transform it to an electronic document or output to a PCL/PS/AFP printer.

RedTitan® DataStream Converter is a processor for Xerox® Job Source Language (JSL) that emulates full print jobs from Xerox Centralised Electronic Printers (CEP) on other types of printer. It uses the JSL files from the CEP, along with associated forms, fonts, images, DJDE and metacode commands, and dynamically converts this with the input data stream into any of these formats:

Adobe® PostScript for any PostScript level 1 or 2 desktop or production printer. If running PostScript level 1 then some peripheral commands (e.g. tray selection) may not have any effect.

PCL for Hewlett-Packard® PCL5e compatible printers.

VIPP (Variable Data Intelligent PostScript PrintWare) for Xerox PostScript printers (DocuPrint/Tech/Color NPS).

AFPDS for IBM® AFP (Advanced Function Printing) printers.

Adobe® PDF (Portable Document Format) for viewing and printing from any PDF reader.

DataStream Converter's principal use is as a migration tool, allowing Xerox CEP users to upgrade to PCL or VIPP/PostScript printing without needing to rewrite application programs. It also means that a desktop printer can substitute for the CEP for small jobs or when the CEP is unavailable.

For users continuing to run a Xerox CEP, DataStream Converter is a useful development tool, allowing you to compile and test new and existing CEP documents on a desktop printer, and to check them with the variable data stream.

The developer package of Legacy Migration System provides many powerful features to assist in setting up a job, checking the component parts and diagnosing problems. The Toolkit lets you run the data and form merged on the PC screen for viewing and sampling of individual pages from high volume jobs. There is also a JSL Editor program for debugging new or existing JSL files: this highlights syntax errors; displays different commands in colours; and provides a detailed context-sensitive Help about JSL commands.

The developer package integrates fully with the modules of the RedTitan Document Design System (Page Designer, Page Compiler, Font/Image Converter) so you can design forms and create, edit and convert all printer resources between CEPs and other printers.
